 XX Genotyping cholinergic receptor, nicotinic, beta-polypeptide 2 gene of an
 PT individual involves determining for two copies of the gene, the identity
 PT of nucleotide pair at polymorphic sites selected from PSI-24.
 XX Claim 17; Page 15; 82pp; English.
 XX The invention relates to genotyping/haplotyping the cholinergic receptor,
 CC nicotinic, beta-polypeptide 2 (neuronal) (CHRN2) gene of an individual,
 CC comprising determining for the two copies of the CHRN2 gene present in
 CC the individual, the identity of the nucleotide pair at one or more
 CC polymorphic sites selected from PSI-24. Also include are oligonucleotides
 CC for performing the method and the nucleotide sequence of the polymorphic
 CC variants of CHRN2. The method is useful for detecting novel CHRN2
 CC polymorphisms and for determining if an individual has a haplotype or
 CC haplotype pairs defined in the specification and to validate CHRN2 as a
 CC candidate agent for treating a specific condition or disease predicted to
 CC be associated with CHRN2 activity (e.g. a memory disorder, Alzheimer's
 CC disease, epilepsy, a learning disorder, schizophrenia, attention
 CC deficit/hyperactivity disorder, (ADHD) and autosomal dominant nocturnal
 CC frontal lobe epilepsy (ADNFLE)), and in the design of clinical trials of
 CC candidate drugs for treating a specific condition or disease predicted to
 CC be associated with CHRN2 activity. The method is useful to screen for
 CC compounds targeting CHRN2 to treat a specific conditions or disease
 CC associated with CHRN2 activity. The polymorphic nucleic acids are useful
 CC in studying the expression and function of CHRN2, and in expressing
 CC CHRN2 protein for use in screening for candidate drugs to treat diseases
 CC related to CHRN2 activity and are useful for therapeutic purposes. The
 CC CHRN2 gene is located on chromosome 1q21. The present sequence is an
 CC allele specific oligonucleotide (ASO) PCR primer (3' terminus) for
 CC performing the method of the invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
XX gene expression (SAGE) tags, useful for studying, monitoring and
XX affecting phases of the cell cycle.
XX Example; Page 30; 419pp; English.
XX The present invention describes an isolated DNA molecule comprising a
XX coding sequence of a yeast gene selected from a group of 745 NORF (not
XX previously assigned open reading frame; or nonannotated ORF) genes
XX comprising a SAGE (serial analysis of gene expression) tag. Also
XX described are: (1) a method (M1) of using NORF genes to affect the cell
XX cycle comprising administering a NORF gene whose expression varies by at
XX least 10% between any two phases of the cell cycle selected from log
XX phase, S phase and G2/M; (2) a method (M2) for screening candidate
XX antifungal drugs comprising: (a) contacting a test substance with a yeast
XX cell; and (b) monitoring expression of a NORF gene whose expression
XX varies as in M1, where a test substance which modifies the expression of
XX the yeast gene is a candidate antifungal drug; (3) a method (M3) for
XX identifying human genes which are involved in cell cycle progression
XX comprising contacting human DNA with a probe which comprises at least 10
XX contiguous nucleotides of a NORF gene whose expression varies as in M1;
XX and (4) a method (M4) for identifying a candidate drug as a member of a
XX class of drugs having a characteristic effect on gene expression in a
XX yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose
XX expression is affected by the class of drugs. The NORF genes may be used
XX to study, monitor and affect phases of the cell cycle, the differentially
XX expressed genes may be used as markers of phases of the cell cycle. The
XX methods may be used to identify candidate drugs which affect the cell
XX cycle and for identification of antifungal drugs. AAF33268 to AAF4064

described are: (1) a method (M1) of using NORF genes to affect the cell
cycle comprising administering a NORF gene whose expression varies by at
least 10% between any two phases of the cell cycle selected from log
phase, S phase and G2/M; (2) a method (M2) for screening candidate
antifungal drugs comprising: (a) contacting a test substance with a yeast
cell; and (b) monitoring expression of a NORF gene whose expression
varies as in M1, where a test substance which modifies the expression of
the yeast gene is a candidate antifungal drug; (3) a method (M3) for
identifying human genes which are involved in cell cycle progression
comprising contacting human DNA with a probe which comprises at least 10
contiguous nucleotides of a NORF gene whose expression varies as in M1;
and (4) a method (M4) for identifying a candidate drug as a member of a
class of drugs having a characteristic effect on gene expression in a
yeast cell comprising contacting a yeast cell with a candidate drug and
monitoring expression in the yeast cell of at least 1 NORF gene whose
expression is affected by the class of drugs. The NORF genes may be used
to study, monitor and affect phases of the cell cycle, the differentially
expressed genes may be used as markers of phases of the cell cycle. The
methods may be used to identify candidate drugs which affect the cell
cycle and for identification of antifungal drugs. AAF33268 to AAF4064.

CC  The present invention describes an isolated DNA molecule comprising a
CC  coding sequence of a yeast gene selected from a group of 745 NORF (not
CC  previously assigned open reading frame; or nonannotated ORF) genes
CC  comprising a SAGE (serial analysis of gene expression) tag. Also
CC  described are: (1) a method (M1) of using NORF genes to affect the cell
CC  cycle comprising administering a NORF gene whose expression varies by at
CC  least 10% between any two phases of the cell cycle selected from log
CC  phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC  antifungal drugs comprising: (a) contacting a test substance with a yeast
CC  cell; and (b) monitoring expression of a NORF gene whose expression
CC  varies as in M1, where a test substance which modifies the expression of
CC  the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC  identifying human genes which are involved in cell cycle progression
CC  comprising contacting human DNA with a probe which comprises at least 10
CC  contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC  and (4) a method (M4) for identifying a candidate drug as a member of a
CC  class of drugs having a characteristic effect on gene expression in a
CC  yeast cell comprising contacting a yeast cell with a candidate drug and
CC  monitoring expression in the yeast cell of at least 1 NORF gene whose
CC  expression is affected by the class of drugs. The NORF genes may be used
CC  to study, monitor and affect phases of the cell cycle, the differentially
CC  expressed genes may be used as markers of phases of the cell cycle. The
CC  methods may be used to identify candidate drugs which affect the cell
CC  cycle and for identification of antifungal drugs. AAF33268 to AAF44064
CC  represent SAGE tags used in the exemplification of the present invention.
CC  AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC  method, in the exemplification of the present invention

XX
XX Identifying pain-regulating compounds, useful for treating chronic pain
DR and for diagnosis, by measuring binding of compounds to specific peptides
XX and proteins.
XX
XX Example 1; Page 62; 213pp; German.
PS
XX The invention relates to identifying pain-regulating substances (A)
CC comprises (i) incubating a test substance with a cell (or preparation
CC from it) that has synthesised a peptide or protein (B) and (ii) measuring
CC either binding of the test substance to (B) or some functional parameter
CC that is altered by this binding. The method is useful for identifying
CC pain-regulating substances (A) with analgesic activity. (A) along with
CC nucleic acid (ABL8411-ABL88441) that encode proteins (B, ABB85006-
CC ABB85037) that interact with (A); (B); vectors containing the nucleic
CC acid; antibodies against (B); cells that express (B) and agents that bind
CC to (B), are all useful for treating pain, particularly chronic pain,
CC including use in gene therapy. The same materials can also be used for
CC diagnosis, e.g. of neurological and neurodegenerative diseases. The
CC present sequence is that of a PCR primer, used in examples of the
CC invention

XX
XX New polymorphic variants comprising small inducible cytokine A3 (SCYA3)
PT isogene, useful in expressing SCYA3 protein for use in screening for
PT candidate drugs to treat diseases related to SCYA3 activity, e.g.
PT inflammatory disorders.
XX
XX Claim 17; Page 15; 67pp; English.
PS
XX The present invention relates to novel single nucleotide polymorphisms
CC (SNPs) in the human small inducible cytokine A3 (SCYA3) gene located on
CC chromosome 17q11-q21, and methods for haplotyping and/or genotyping the
CC SCYA3 gene. The methods of the invention make use of allele-specific
CC oligonucleotides (ASOs) as probes and primers and/or primer-extension
CC oligonucleotides for detecting the SCYA3 gene polymorphisms. The
CC polynucleotides and screened compounds are useful for (developing)
CC treatment of diseases associated with SCYA3 activity, such as
CC inflammatory disorders e.g. atopic dermatitis, rheumatoid arthritis,
CC multiple sclerosis, pulmonary fibrosis and sarcoidosis. AAS18713-AAS18742

PS

XX The present invention describes an isolated polynucleotide (I) comprising
 CC a sequence which is a polymorphic variant (PV) of a reference sequence
 CC for aldo-keto reductase family 1, member B1 (AKR1B1) gene or its
 CC fragment, having the 2214 base pair sequence given in ABL01105. AKR1B1
 CC has antidiabetic activity and can be used in gene therapy. AKR1B1 can be
 CC used in the treatment of diabetes. The human AKR1B1 gene is located on
 CC chromosome 7q35. ABL01107 to ABL01129 represent allele-specific
 CC oligonucleotide (ASO) probes used in the detection of polymorphisms in
 CC the human AKR1B1 gene; ABL01130 to ABL01175 represent ASO primers used in

XX Novel polymorphic variants of colony stimulating factor 1 receptor useful
 PT in studying expression and function of the protein, useful for screening
 PT candidate drugs to treat diseases e.g. inflammatory disorders.

XX Claim 17; Page 18; 164pp; English.

XX The invention describes a novel isolated polynucleotide (I) comprising a
 CC sequence which is a polymorphic variant (PV) of a reference sequence for
 CC colony stimulating factor 1 receptor (CSF1R) gene, found on The
 CC polypeptide are useful for improving the discovery and development of
 CC drugs for treating diseases associated with CSF1R activity, e.g.,
 CC malignant histiocytosis, myeloid malignancies, and inflammatory disorders
 CC and the haplotypes can be used to validate CSF1R as a candidate target
 CC for treating a specific condition or disease predicted to be associated
 CC with CSF1R activity. Genotyping the CSF1R gene of an individual can also
 CC be used in developing diagnostic tests and therapeutic treatments. (I) is

CC useful in studying the expression and function of CSF1R, and in
 CC expressing CSF1R protein for use in screening for candidate drugs to
 CC treat diseases related to CSF1R activity and in studying the effect of
 CC the variation on the biological activity of CSF1R as well as on the
 CC binding affinity of candidate drugs targeting CSF1R. Antibodies are
 CC useful in a variety of diagnostic and prognostic formats and therapeutic
 CC methods. A transgenic animal is useful in studying expression of the
 CC CSF1R isogenes in vivo, for in vivo screening and testing of drugs
 CC targeted against CSF1R protein, and for testing the efficacy of
 CC therapeutic agents and compounds. Allele specific oligonucleotides (ASO)
 CC are useful as probes and primers, and for assaying a polymorphism in the
 CC target region. Without requiring any a priori knowledge of the phenotypic
 CC effect of any particular CSF1R or haplotype the invention provides a
 CC method for identifying lead compounds that are more likely to show
 CC efficacy in clinical trials. This sequence is a primer used to detect
 CC CSF1R gene polymorphisms by primer extension, described in the method of
 CC the invention

XX New genetic variants of mucin 1, Transmembrane gene, useful in studying
 PT expression and function of protein encoded by the gene and for screening
 PT drugs to treat diseases e.g. cancer.

XX Claim 16; Page 14; 75pp; English.

XX The invention relates to a polynucleotide (ABL60158, ABL60159) encoding
 CC mucin 1/MUC1 (AB077476), Transmembrane isogene. The invention describes
 CC novel genetic variants of the MUC1 gene. The invention is useful for
 CC haplotyping/genotyping the MUC1 gene in an individual and identifying an
 CC association between a trait and at least one of the haplotypes or
 CC haplotype pairs of MUC1 gene. MUC1 is useful for studying the expression
 CC and function of MUC1 and expressing MUC1 protein for use in screening for
 CC candidate drugs to treat diseases related to MUC1 activity and in
 CC studying the effect of the variation on the biological activity of MUC1
 CC as well as on the binding affinity of candidate drugs targeting MUC1 for
 CC the treatment of e.g. cancer. MUC1 is further used by the pharmaceutical
 CC research scientist to validate MUC1 as a candidate target for and in
 CC design of clinical trials of candidate drugs for, treating a specific
 CC condition drugs or disease predicted to be associated with MUC1 activity.
 CC MUC1 antibodies are useful in a variety of diagnostic and prognostic
 CC formats and therapeutic methods. The present sequence is that of a PCR
 CC primer for detecting MUC1 polymorphisms, useful to the invention

 XX New polymorphic variants comprising acetylcholinesterase (ACHE) isogene,
 PT useful in expressing ACHE protein for use in screening for candidate
 PT drugs to treat diseases related to ACHE activity, e.g. neurological
 PT diseases or cancer.
 XX Claim 18; Page 14; 79pp; English.
 XX The invention relates to a polynucleotide comprising a polymorphic
 CC variant of an acetylcholinesterase (ACHE) gene or fragment, protein or
 CC complement, the variant comprising an ACHE isogene defined by a haplotype
 CC selected from haplotypes 1-20 listed in the specification. Also included
 CC are methods for haplotyping and genotyping the ACHE gene of an
 CC individual, a method for predicting a haplotype pair for the ACHE gene of
 CC an individual, a method for identifying an association between a trait
 CC and at least one haplotype or haplotype pair of ACHE gene, recombinant
 CC nonhuman organisms transformed or transfected with the polynucleotide
 CC where the organism expresses ACHE protein encoded by the first nucleotide
 CC sequence or encoded by the polymorphic variant sequence, an isolated
 CC antibody specific for and immunoreactive with ACHE, a method of screening
 CC for drugs targeting the polypeptide contacting ACHE polymorphic variant
 CC with a candidate agent and assaying for binding activity, a computer
 CC system for storing and analysing polymorphism data for ACHE gene and a
 CC genome anthology for ACHE gene which comprises ACHE isogenes defined by
 CC haplotypes 1-20 given in the specification. The Polymorphisms are useful
 CC for studying the biological function of ACHE as well as in identifying
 CC drugs targeting this protein for the treatment of disorder related to its
 CC abnormal expression or function. The polymorphic variants may also be
 CC used in screening for compounds targeting ACHE to treat a specific
 CC condition or disease predicted to be associated with ACHE activity e.g.
 CC neurological diseases (e.g. Parkinson's disease and Alzheimer's disease),
 CC cancer, leukaemia, and tumours. The ACHE gene maps to human chromosome
 CC 7q22. The present sequence is the allele specific (ASO) portion of a PCR
 CC primer used in a primer extension experiment to detect the polymorphic
 CC ACHE variants of the invention

 XX Polynucleotide encoding breast-specific tumor polypeptides useful as
 PT vaccine for preventing and treating breast cancer in a subject.
 XX Example 1; Col 85; 128pp; English.
 CC The invention relates to an isolated DNA molecule (I) encoding breast-
 CC tumour-specific polypeptides. (I) is useful as a vaccine for preventing
 CC and treating breast cancer in a subject. The polypeptide encoded by (I)
 CC is used for production of compounds such as antibodies useful in
 CC diagnosing and monitoring the progression of breast cancer. ABK46614-
 CC ABK46999 represent human breast tumour-specific coding sequences and
 CC related PCR primers of the invention

PT oxidoreductase (POR) isogene, useful in improving the efficiency of drug
PT screening protocols for compounds targeting POR.
XX
XX
XX Claim 16; Page 15; 141pp; English.
XX
XX The present invention provides the protein, gene and cDNA sequences of
CC human P450(cytochrome) oxidoreductase POR, and single nucleotide
CC polymorphisms (SNPs) identified therein. The sequences can be used to
CC haplotype the POR gene of an individual, and to establish whether POR is
CC a suitable target for drugs to treat cancer and disorders associated with
CC impaired protein synthesis in cells. The present sequence is an allele
CC specific primer extension oligonucleotide for the coding sequences of the
CC invention

XX
XX Claim 19; Page 12; 60pp; Japanese.
XX
XX The invention relates to SAGE (serial analysis of gene expression) tags
CC representing groups of genes which are expressed in activated human Th1
CC and/or Th2 cells. The SAGE tags of this invention consist of a sequence
CC of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif

CC lying nearest to the polyA region of cDNAs derived from a variety of
CC genes. These tags serve to uniquely identify each transcript and can thus
CC be used to analyse the pattern of gene expression in particular cell
CC types. The invention also relates to proteins encoded by the genes
CC expressed in Th1 and/or Th2 cells, antibodies against these proteins, and
CC inhibitors of the expression of groups of genes that are expressed in Th1
CC either or both the two cell types. Groups of genes expressed in Th1
CC and/or Th2 cell types may be used for the diagnosis and treatment of Th1
CC and Th2-related disorders. Sequences ABV78390-ABV78560 are SAGE tags
CC representing 171 genes which are more highly expressed in Th1 cells
CC compared with Th2 cells

XX
XX Claim 37; Page 24; 139pp; Japanese.
XX
XX The invention relates to SAGE (serial analysis of gene expression) tags
CC representing groups of genes which are differentially expressed in human
CC chronic hepatitis C (CH) liver tissue or hepatitis C-induced
CC hepatocellular carcinoma (HCC) compared with normal human liver tissue.
CC The SAGE tags of this invention consist of a sequence of 10 nucleotides
CC located downstream of the 5'-CATG-3' sequence motif lying nearest to the
CC polyA region of cDNAs derived from a variety of genes. These tags serve
CC to uniquely identify each transcript and can thus be used to analyse the
CC pattern of gene expression in particular cell types. The invention also
CC relates to proteins encoded by the genes expressed in chronic hepatitis C
CC liver tissue or HCC, antibodies against these proteins, and inhibitors of
CC the expression of groups of genes that are overexpressed in chronic
CC hepatitis C liver tissue or HCC. Groups of genes differentially expressed
CC in chronic hepatitis C tissue or HCC may be used for the diagnosis and
CC treatment of these diseases. Such genes, inhibitors of their expression
CC or activity, and antibodies against the gene products may be used in the
CC development of drugs to treat chronic hepatitis C and/or HCC. Sequences

CC ABV84591-ABV84690 are SAGE tags representing the 100 most highly expressed genes out of those genes which are overexpressed in hepatocellular carcinoma compared with chronic hepatitis C liver tissue

 PT Novel genetic variants of soluble carrier family 18 (vesicular
 PT monoamine), member 2 gene useful for screening drugs to treat diseases
 PT e.g. neuropsychiatric disorders involving monoaminergic brain systems.
 XX
 PS Claim 19; Page 15; 183pp; English.

CC The present invention describes an isolated polynucleotide (I) having a
 CC sequence (S1) comprising soluble carrier family 18 (vesicular monoamine),
 CC member 2 (SLC18A2) isogene selected from 49 isogenes with regions of a
 CC sequence (S2) of 4023 bp (see ABL51954), and defined by a corresponding
 CC set of polymorphisms whose locations and identities are given in the
 CC specification; or a sequence (S2) complementary to (S1). (I) has
 CC antiinflammatory and neuroleptic activities, and can be used in gene
 CC therapy. Methods from the present invention can be used for haplotyping
 CC and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known
 CC as the vesicular monoamine transporter (VMAT2). (I) is useful in studying
 CC the expression and function of SLC18A2, and in expressing the SLC18A2
 CC protein for use in screening for candidate drugs to treat diseases
 CC related to SLC18A2 activity and in studying the effect of the variation
 CC on the biological activity of SLC18A2 as well as on the binding affinity
 CC of candidate drugs targeting SLC18A2 for the treatment of respiratory
 CC inflammatory diseases such as neuropsychiatric disorders involving
 CC monoaminergic brain systems. The present sequence represents a preferred

CC oligonucleotide primer for human SLC18A2, which is given in the present
 CC invention

 PT Determining genetic risk of arteriosclerosis, for clinical diagnosis,
 PT comprises hybridizing patient nucleic acid with an array of probes
 PT derived from risk-associated reference genes and their mutations.
 XX
 PS Example 1; Page 140; 146pp; German.

CC This invention describes a novel method for determining the genetic risk
 CC of arteriosclerosis both for clinical diagnosis and for population
 CC studies. The method comprises: (i) selecting risk-associated reference
 CC nucleic acid sequences, including their functionally characterizing
 CC mutations; (ii) applying probes from these sequences, or their
 CC complements, to a carrier; (iii) hybridising the probes with a nucleic
 CC acid from (or synthesised from) a patient sample; and (iv) detecting and
 CC evaluating the hybridisation pattern. The method provides a quick,
 CC inexpensive and informative diagnosis, and makes possible a
 CC multifactorial analysis for detecting e.g. synergism between different
 CC mutations or mutations that when present alone carry no risk but are risk
 CC -associated in presence of other mutations. The results may be combined
 CC with known risk-assessment methods to provide a more reliable diagnosis,
 CC especially important with new therapeutic methods (e.g. gene therapy)
 CC that are directed against specific genes. All relevant mutations in a
 CC reference sequence can be screened for in a single test and the method is
 CC well suited to automation. ABX09147-ABX09676 represent probes used to
 CC illustrate the method of the invention

 XX PT Novel genetic variants of 3-hydroxy-3-methylglutaryl coenzyme A lyase
 XX PT useful in screening drugs to treat disease associated with the protein
 XX PT e.g. 3-hydroxy-3-methylglutaryl coenzyme A deficiency.
 XX PS Claim 19; Page 13; 84pp; English.
 XX CC The present invention relates to a new polynucleotide having a sequence
 XX CC comprising a 3-hydroxy-3-methylglutaryl coenzyme A lyase (HMGL) isogene,
 XX CC selected from 6 isogenes, and defined by a corresponding set of
 XX CC polymorphisms whose locations and identities are given in the
 XX CC specification. The method of the invention is useful for haplotyping the
 XX CC HMGL gene in an individual and in design of clinical trials of candidate
 XX CC drugs for treating a specific condition or disease predicted to be
 XX CC associated with HMGL activity and is useful for genotyping HMGL gene of
 XX CC an individual. The method of the invention is also useful for identifying
 XX CC an association between a trait and at least one haplotype or haplotype
 XX CC pair of HMGL gene. ASO is useful as probes and primers and for assaying
 XX CC a polymorphism in the target region. The invention is useful for
 XX CC genotyping and/or haplotyping the HMGL gene in an individual. Without
 XX CC requiring any a prior knowledge of the phenotypic effect of any
 XX CC particular HMGL haplotype or haplotype pair, the method of the invention
 XX CC provides the scientist with a tool to identify lead compounds that are
 XX CC more likely to show efficacy in clinical trials. The present nucleic acid
 XX CC sequence represents one of a collection of ASO oligonucleotide primers
 XX CC (ABK14434-ABK14445) that were used in the invention to detect
 XX CC polymorphisms in the human HMGL gene

 PT comprises improved selection of genes encoding target antigens.
 XX
 XX Example 4; Page 19; 54pp; English.
 XX
 CC The present invention relates to novel methods for the identification of
 CC antigens recognised by cytotoxic T cells (CTLs) and specific for human
 CC tumours, cancers and infected cells. The method involves screening the
 CC products of an expression library generated from DNA/RNA of a cell
 CC expressing a target epitope with cytotoxic T cells generated against the
 CC cell to identify DNA clones expressing target epitope or providing
 CC cytotoxic T cells specific for a gene product differentially expressed by
 CC a cell and measuring the cross-reactivity of the cytotoxic T cells for
 CC cells expressing a target epitope in which the target epitope is
 CC identified as a gene product inducing cytotoxic T cells. The method is
 CC useful for identifying a target epitope or antigen specific for a tumour
 CC cell. The target epitope is also useful for identifying target antigens
 CC in other target cells against which it is desirable to induce cell-
 CC mediated immunity. The antigen identified by the method is useful in
 CC immunogenic compositions and vaccine preparations to induce the
 CC regression of tumours, cancers and infections in mammals. The invention
 CC also relates to vaccinia viral vectors which are useful for treating
 CC tumour-bearing mammals, including humans to generate immune response
 CC against the tumour cells. They are also useful for immunising or
 CC vaccinating tumour-free subjects to prevent tumour formation. The present
 CC DNA sequence is an arbitrary primer which is used for modified
 CC differential display of genes encoding potential tumour immunogens. This
 CC primer is used in the exemplification of the invention

 DR
 XX New nucleic acid regulatory sequences, which are able to regulate
 PT

PT expression of a gene operably linked to a promoter, useful for regulating
 PT the expression of transgenes and for treating e.g., cancer and
 XX immunological diseases.

PS Claim 15; Page 56; 95pp; English.

XX The invention describes an isolated nucleic acid regulatory sequence for
 CC a cyclin D1 promoter, a CD40L promoter, vancomycin-resistant enterococci
 CC (VRE) promoter, an HBV promoter, androgen receptor (AR) promoter, Human
 CC epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase
 CC (Bla) promoter. Transcription regulatory sequences may be used to
 CC regulate expression of the endogenous, autologous or heterologous genes
 CC operably linked to the promoter, and may be incorporated into
 CC heterologous nucleic acid constructs for use in regulated expression of
 CC transgenes. Regulated expression of cyclin D1 can be used in cancer
 CC therapies, such as breast, colon or pancreatic cancers and familial
 CC adenomatous polyposis. Regulation of the activity of CD40L gene promoter
 CC may be used in the treatment of immunological disorders, such as
 CC autoimmune diseases e.g. multiple sclerosis (MS), systemic lupus
 CC erythematosus (SLE), graft-vs-host disease (GVHD) and rheumatoid
 CC arthritis. Regulated expression of genes under the control of the HBV
 CC (hepatitis B)-specific core, pre-S and X promoters can be used in the
 CC therapy of HBV disease, chronic hepatic insufficiency, cirrhosis,
 CC hepatocellular carcinoma, and in the regulated expression of liver cell-
 CC specific genes. Regulated expression of the vhh gene promoter can be
 CC used in treatment of Enterococcus infection, while regulated expression
 CC of the androgen receptor gene can be used in the treatment of prostate
 CC cancer. This sequence represents a primer used in the invention to
 CC determine the functions of regions within the selected promoters,
 CC described in the method of the invention

XX Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene
 PT useful in studying expression and function of the protein, and for
 PT screening drugs to treat diseases e.g. Hodgkin's disease.

XX Claim 19; Page 15; 109pp; English.

XX The invention comprises the human lysosomal acid phosphatase 2 (ACP2)
 CC nucleic acid and protein sequences. Specifically, the invention relates
 CC to the discovery of 22 novel polymorphic sites within the APC2 gene. The
 CC invention also comprises methods for haplotyping and genotyping the ACP2
 CC gene in an individual. The ACP2 gene (located on chromosome 11) encodes a
 CC lysosomal-specific enzyme that catalyses the hydrolysis of
 CC orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and
 CC protein are pharmaceutically important in the treatment of Hodgkin's
 CC disease (HD) and acid phosphatase deficiency. The novel ACP2 gene
 CC polymorphisms of the invention are useful in haplotyping the ACP2 gene.
 CC ACP2 haplotyping is useful in validating ACP2 as a target (and designing
 CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's
 CC disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are
 CC useful for ACP2 genotyping, which can also be used to develop diagnostic
 CC tests and therapeutic treatments. The ACP2 protein and nucleic acids of
 CC the invention are useful in the production of a transgenic animal which
 CC expresses ACP2 protein. The ACP2 nucleic acids of the invention are
 CC useful in the production of allele-specific oligonucleotides designed to
 CC genotype each of the ACP2 polymorphisms. Nucleic acids ABL36299-ABL36320
 CC represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-
 CC ABL36364 represent claimed ACP2 allele-specific PCR primers. Nucleic
 CC acids ABL36365-ABL36408 represent claimed ACP2 primer-extension
 CC oligonucleotides

XX New breast tumor proteins nucleic acids encoding such proteins, useful in
 PT diagnosing, preventing and/or treating diseases such as cancer,
 PT particularly breast cancer, and as markers for detecting the presence of
 PT a cancer.

XX Example 1; Page 70; 190pp; English.

XX The invention relates to a breast tumour polynucleotide selected from one
 CC of the 275 fully defined nucleotide sequences (a) given in the
 CC specification, including their complements, sequences consisting of at
 CC least 20 contiguous residues of a sequence in (a), sequences that
 CC hybridise to a sequence in (a) under moderately stringent conditions,
 CC sequences having at least 75% or 90% identity to a sequence in (a), or
 CC degenerate variants of a sequence in (a). Also included are an isolated
 CC polypeptide (II) (comprising an amino acid sequence selected from
 CC sequences encoded by (a), sequences having at least 70% or 90% identity
 CC to a sequence encoded by (a), sequences of 30 fully defined amino acid
 CC sequences (c), and sequences having at least 70% or 90% identity to a
 CC sequence in (c)), expression vectors comprising (a), a host cell
 CC transformed or transfected with the expression vector, an isolated
 CC antibody or its antigen-binding fragment that specifically binds to (II),
 CC a method for detecting the presence of a cancer in a patient, a fusion
 CC protein comprising at least one polypeptide (II), an oligonucleotide that
 CC hybridises to (a), under moderately stringent conditions, a method for
 CC stimulating and/or expanding T cells specific for a tumour protein (by
 CC contacting T cells with at least one component selected from (a), (II)
 CC and antigen-presenting cells that express (II)), an isolated T cell
 CC population comprising T cells prepared from as detailed above, a method
 CC for stimulating an immune response or treating cancer in a patient by
 CC administering a composition comprising (a), (II), the vector, cells or
 CC the antibodies, and a method for inhibiting the development of a cancer
 CC in a patient. The polynucleotides may be used in the design and
 CC preparation of ribozyme molecules for inhibiting expression of the tumour
 CC polypeptides and proteins in tumour cells. The breast tumour proteins are
 CC useful as markers to indicate the presence or absence of a cancer, such
 CC as breast cancer, and in the detection of other cancers. Compositions
 CC comprising the breast tumour proteins are useful in diagnosing,
 CC preventing and/or treating diseases such as cancer, particularly breast
 CC cancer. The present sequence is a differential display random PCR primer
 CC used in the isolation of breast cancer specific cDNAs of the invention.

 CC gene (see also ABV76204) by the primer extension method. The invention is
 CC based on the discovery of 3 novel polymorphic sites (PS1-PS3) in the NNMT
 CC gene. The identity of the alleles at these sites were determined in a
 CC human reference population of 79 unrelated individuals self-identified as
 CC belonging to African descent, Asian, Caucasian and Hispanic/Latino
 CC population groups. The invention provides a method, composition and kit
 CC for genotyping the NNMT gene in an individual. A genotyping kit
 CC composition comprises a probe or primer designed to specifically
 CC hybridise to a target region containing, or adjacent to, one of the NNMT
 CC polymorphic sites. A genotyping kit comprises a set of oligonucleotides
 CC designed to genotype each of the NNMT polymorphic sites. The invention
 CC also provides a method for haplotyping the NNMT gene. This is useful for
 CC improving the development of drugs metabolised by NNMT or drugs for
 CC treating diseases associated with NNMT activity, e.g. Parkinson's disease
 CC and cancer cachexia (claimed). The invention is also useful for screening
 CC compounds that target NNMT, and for identifying associations between a
 CC trait and a NNMT genotype, haplotype or haplotype pair for one or more of
 CC the novel polymorphic sites

XX
XX The invention relates to a novel RNA retro-position comprising the
XX transcription of an RNA containing a 3' UTR fragment of a LINE in cells;
XX and trans-positioning the ORF protein of such LINE after expressing from
XX other than the RNA. The invention further comprises a similar method in
XX which the transcription of an RNA containing a 3' UTR fragment of an APE
```

CC domain-carrying type site-specific LINE in cells, and expressing the ORF
 CC protein of the LINE in such cells; or transcribing of an RNA containing
 CC 3' UTR fragment of a LINE in cells, and expressing ORF protein in such
 CC cells thereby modifying a retro-transposition target site of a LINE by
 CC substituting the endonuclease domain of the LINE by that of another LINE
 CC via ORF protein of such LINE. The invention also includes a retro-
 CC transposition vector with RNA encoding the 3' UTR fragment of a LINE but
 CC not expressing the encoded ORF of the LINE; a vector encoding a protein
 CC for substitution of the endonuclease domain of an encoded ORF protein in
 CC the site-specific LINE by the endonuclease domain of the encoded ORF
 CC protein in another LINE; and a kit for gene transfer through retro-
 CC transposition of an RNA. The method is useful for transferring targeted,
 CC specific genes or nucleic acids of an endonuclease domain via
 CC substitution to a chromosome using a virus vector, which is applicable in
 CC gene therapy. The retro-transposition in the host is highly efficient by
 CC targeting specifically at LINE, and with little damage to the host due to
 CC the gene transfer. This polynucleotide sequence represents an
 CC oligonucleotide used in the exemplification of the invention.

 XX Example 1; SEQ ID NO 103; 308pp; English.

XX The present invention relates to compositions and methods for the therapy
 CC and diagnosis of cancer, particularly breast cancer. The method for
 CC detecting the presence of a cancer in a patient comprises: obtaining a
 CC biological sample from the patient; contacting the biological sample with
 CC a binding agent that binds to the polypeptide; detecting in the sample an
 CC amount of the polypeptide that binds to the binding agent; and comparing

CC the amount of the polypeptide to a predetermined cut-off value. Treating
 CC breast cancer comprises administering a composition comprising breast
 CC tumour proteins and nucleic acids, which simulates and/or expands T cells
 CC specific for the tumour protein. The present sequence was used to
 CC illustrate the invention.

 PT Treating infection or reactivation caused by Herpes virus comprises using
 PT antagonist of Herpes Simplex virus polynucleotide sequence and interferon
 PT regulatory factor-1.

XX
 XX Example 3; SEQ ID NO 112; 53pp; English.

XX The invention relates to treating viral infection or reactivation
 CC comprising contacting an individual with an antagonist of the interaction
 CC between a Herpes Simplex virus (HSV) polynucleotide sequence appearing as
 CC ADD07153 and interferon regulatory factor-1 (IRF-1, a transcription
 CC factor of the interferon regulatory pathway). Also included are an
 CC isolated HSV polynucleotide comprising ADD07153, a composition comprising
 CC a HSV polypeptide involved in viral infection or reactivation, screening
 CC for compounds capable of inhibiting specific binding of IRF-1 to a
 CC polynucleotide, screening for compounds capable of inhibiting specific
 CC binding of IRF-1 to IRF-1:IRF-BP (undefined) complex, a compound capable
 CC of agonising or antagonising any compound in IRF-1 and/or interferon
 CC genetic regulatory pathway and a composition for comprising an HSV IRF-1
 CC binding site consensus sequence. The method is useful for treating
 CC infection or reactivation caused by Herpes virus, e.g., HSV-1 or HSV-2
 CC infections and for cytomegalovirus, Epstein Barr virus and zoster virus
 CC infection. The HSV polypeptide and polynucleotides may also be useful as
 CC antiviral vaccines. An experiment was performed where cDNA from the
 CC transgenimal ganglia of mice infected with HSV was isolated by
 CC differential display reverse transcriptase PCR (DDRT-PCR). The present
 CC sequence is a DDRT-PCR primer used in the experiment.

XX PS New polynucleotides encode lung tumor antigens and are useful to
XX FT stimulate an immune response or detect or treat a cancer in a patient,
XX XX particularly lung cancer.
XX PS Example 1; SEQ ID NO 48; 63pp; English.
XX CC The invention relates to polynucleotides encoding lung tumour antigens.
XX CC The invention also relates to the polypeptides encoded by the
XX CC polynucleotides, isolated antibodies or antigen-binding fragments that
XX CC specifically bind the polypeptides and a method for detecting cancer in a
XX CC patient, comprising obtaining a biological sample from the patient,
XX CC contacting the sample with a binding agent that binds a polypeptide of
XX CC the invention, detecting in the sample an amount of polypeptide that
XX CC binds to the binding agent, and comparing the amount of polypeptide to a
XX CC predetermined cut-off value. T cells specific for a tumour protein can be
XX CC stimulated and/or expanded by contacting the T cells with a polypeptide,
XX CC polypeptide or an antigen-presenting cell that expresses a
XX CC polypeptide. Cancer development can be inhibited by incubating CD4+
XX CC and/or CD8+ T cells isolated from a patient with a polypeptide,
XX CC polynucleotide or an antigen-presenting cell that expresses a
XX CC polypeptide, so that the T cells proliferate. The invention is used to
XX CC stimulate an immune response or to detect or treat a cancer in a patient,
XX CC particularly lung cancer. This sequence represents a PCR primer used to
```

CC amplify human lung tumour antigen cDNA of the invention. Note: The
CC sequence data for this patent did not form part of the printed
CC specification but was obtained in electronic format from USPTO at

XX
XX Sequence-directed DNA-binding molecules - useful in pharmaceuticals and
XX as molecular reagents.
XX
PS Example 13.E.; Page 522; 587pp; English.
XX
XX A DNA protein-binding assay is provided, useful for screening libraries
XX of synthetic or biological cpds. for their ability to bind DNA test
XX sequences. The assay is versatile in that any number of test sequences
XX can be tested by placing the test sequence adjacent to a defined protein-
XX binding screening sequence. Binding of mols. to these test sequences
XX changes the binding characteristics of the protein mol. to its cognate
XX binding sequence. When such a mol. binds the test sequence, the
XX equilibrium of the DNA:protein complexes is disturbed, generating changes
XX in the concentration of free DNA probe. One application of this method is
XX to eucaryotic general transcription factors (e.g. TFIID), where the
XX target region is typically selected from DNA sequences adjacent to the
XX binding site for the eucaryotic transcription factor. Numerous exemplary
XX test sequences are given: the sequences in AAQ69251-731 and AAQ69850
XX correspond to promoter targets (typically, TATA box-contg. sites) for
XX human genes and the sequences in AAQ69732-849 correspond to promoter
XX targets for viral genes. The test sequences may also be randomly
XX generated. DNA:protein interaction may be used for screening purposes,
XX e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see
XX AAQ69851-52, AAQ69865 and AAQ69891). Example 13 describes a method for
XX selecting target sites for DNA- binding mols. that are dimers or trimers

CC of distamycin. A sequence was identified from the medically significant
CC target site database that contains the sequence given in AAQ69869, which
CC is a subset of the group of sequences represented by the sequence given
CC in AAQ69870. (Updated on 25-MAR-2003 to correct PN field.)

XX
XX Altering binding characteristics of DNA binding proteins to duplex DNA -
XX by attaching specific small cpd. to target region close to the protein's
XX binding site, useful in treatment of viral disease, cancer etc.
XX
XX Example 13; Col 417; 264pp; English.
XX
XX The sequences given in AAT49573-74 represent DNA's which act as target
XX regions in the method of the invention. These sequences overlap the
XX binding site for a transcription factor, nuclear factor of activated T
XX cells (NFAT-1), which is a major regulatory factor in the induction of
XX interleukin 2 expression early in the T cell activation response. These
XX sequences represent target sites for distamycin. The method of the
XX invention comprises altering the binding characteristics of a DNA-binding
XX protein to duplex DNA. The method comprises contacting the duplex DNA
XX with a small molecule which binds sequence-specifically to a target
XX region, where, when the small molecule is bound to the target region, it
XX is adjacent to, but not overlapping by more than 4 bp, a binding site for
XX a DNA-binding protein. The small molecule is added at a concentration
XX effective to alter the binding of the DNA binding protein, pref. TFIID,
XX to its binding site on the duplex DNA. The binding of the small molecule
XX may inhibit or enhance the binding of the DNA-binding protein to its
XX binding site. The compounds isolated using this method are potentially
XX useful as therapeutic agents for treatment of any disease which involves
XX a specific DNA sequence, e.g. cancer, or inherited genetic disorders etc.

XX New mammalian model for enhanced wound healing - useful for identifying enhanced wound healing genes.
PT Claim 13; Page 55; 136pp; English.
XX This invention describes a novel non-MRL healer mouse (M) having at least one quantitative trait locus selected from those given in the specification, exhibiting an enhanced healing response to a wound compared to mice (m) without the locus. The invention describes a novel method of identifying a gene involved in enhanced wound healing by identifying DNA microsatellite markers which can distinguish healer mice from non-healer mice and identifying microsatellite markers which segregate with enhanced wound healing in progeny of the mice, where a chromosomal locus containing at least one enhanced wound healing gene is identified. A method of treating a wound in a mammal is also disclosed. The new methods are useful for treating wounds, especially central and peripheral nerve wound. The methods of the invention are useful for restoring function after nerve injury in a mammal. (M) is useful as a mammalian model of enhanced wound healing, useful for identifying genes and gene products involved in enhanced wound healing, and to provide methods for wound healing. AAZ18691-Z19036 represent murine SAGE tags from C57BL/6 and MRL mice which are used to illustrate the method of the invention

 XX stranded analyte - and hybrid of anchor and reporter sequences, with
 PT reporter released if triplex formation occurs, used e.g. to identify
 PT bacteria.
 XX
 XX Disclosure; Col 23-24; 160pp; English.
 PS
 XX The present sequence represents a polynucleotide that is able to form a
 CC triple helix with a double stranded sequence. Cytosine bases in the
 CC present can be replaced with 5-methylcytosine for increased triplex
 CC stability. The present sequence is used in the assay of the invention,
 CC where it can be part of the anchor DNA or reporter DNA sequence. The
 CC assay comprises adding a sample containing double-stranded DNA test
 CC sequences to an aqueous medium containing at least one complex of anchor
 CC DNA, attached to a solid support, and reporter DNA, where either a part
 CC of the anchor DNA or reporter DNA is designed to form a triple-strand
 CC structure with part of the test sequence. Triplex formation results in
 CC displacement of the reporter DNA which is detected as an indication of
 CC the presence of the DNA test sequence. The method is used to detect DNA
 CC sequences, particularly for identification of bacteria (by detecting
 CC genes for ribosomal RNA) in clinical samples, but also detection of
 CC oncogenes and Hepatitis B virus

 XX Determination of DNA sequence preference of a DNA-binding molecule -
 PT based on inhibition of binding of protein to oligonucleotide sequence
 PT attached to test sequence.
 PT
 XX Disclosure; Col 419; 270pp; English.
 PS
 XX The invention relates to a method of determining the DNA sequence
 CC preference of a DNA-binding molecule. The method comprises: (i) adding a
 CC test molecule and a DNA-binding protein to a mixture of duplex DNA test
 CC oligonucleotides, each of the test oligonucleotides having a test
 CC sequence adjacent to a screening sequence, where the screening sequence
 CC binds to the DNA-binding protein with a binding affinity that is
 CC independent of the DNA sequence of the test sequence, and where the
 CC mixture of duplex DNA test oligonucleotides includes several test
 CC sequences; (ii) incubating the test molecule, the mixture of duplex DNA
 CC test oligonucleotides and the DNA-binding protein for a time sufficient
 CC to permit binding of the test molecule to test sequences in the duplex
 CC DNA; (iii) separating unbound test oligonucleotides from test
 CC oligonucleotides bound to binding protein; (iv) amplifying the unbound
 CC test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating
 CC the amplified test oligonucleotides; and (vii) sequencing the isolated
 CC test oligonucleotides. The invention provides test sequences AAX17001-
 CC AAX17481 and AAX17500 that correspond to promoter targets for human genes
 CC and test sequences AAX17482-X17599 that correspond to promoter targets
 CC for viral genes. The present sequence represents a sample distamycin
 CC target sequence

 XX FT Identifying and inhibiting functional nucleic acid molecules in cells.
 XX PS Example 3; Page 28; 58pp; English.
 XX CC This invention describes a novel method allowing essential or functional
 CC genes to be rapidly identified and inactivated. The method is able to
 CC firstly identify most of the essential genes in an organism (i.e. a
 CC bacteria or a eukaryote) needed for survival, and secondly it provides
 CC for reducing or inactivating their expression. The method is able to
 CC identify functional oligonucleotide molecules able to be used as
 CC diagnostic reagents and therapeutics. The method provides a means for
 CC identifying essential genes whose sequence is known only as part of a
 CC genome with unknown function, as well as a means for identifying
 CC functional oligonucleotide molecules. The method involves the use of a
 CC nucleic acid molecule comprising (a) a first reporter gene encoding a
 CC fusion protein comprising a protein of interest (itself translated from
 CC an RNA of interest) and a reporter protein, a second reporter gene
 CC encoding a second reporter protein, and (c) a targeting gene encoding a
 CC functional oligonucleotide molecule such as an external guide sequence
 CC (EGS), a ribozyme or an antisense RNA and targeted to the RNA of interest
 CC at a site on the first reporter gene able to encode the RNA of interest

 XX FT New peptide-based nucleic acid surrogate (PNAs) for use in therapeutic,
 XX diagnostic and molecular switching applications e.g. alpha-PNA chips.
 XX PS Example; Page 12; 32pp; English.
 XX CC The present sequence is a DNA sequence which hybridises to an alpha-
 CC helical peptide nucleic acid (alphaPNA). The invention relates to novel
 CC peptide-based nucleic acid surrogates comprising a secondary structure
 CC and a subunit with the sequence (AAB-aa)n, where: AA = hydroxyl-amino
 CC acid; B = nucleobase; aa = amino acid; n and m = greater than or equal to
 CC 1. Resin-bound PNAs are formed by solid-phase peptide synthesis and the
 CC resin is then cleaved from the PNAs. The PNAs are useful in therapeutic,
 CC diagnostic and molecular switching applications. The present sequence
 CC binds to nucleotides attached to the alphaPNA to form an alphaPNA.DNA
 CC complex

XX screening for cosmetic or therapeutic agents, based on differential gene
XX expression.
XX
XX Claim 8; Page 41; 325pp; German.
XX
XX The invention relates to identifying (M1) genes in vitro that, in humans
XX or animals, are important for skin ageing and/or skin stress by serial
XX analysis of gene expression between mixtures of transcribed and
XX optionally translated, genetically encoded factors (A) obtained from
XX young and aged skin, to identify that genes that show strong differential
XX expression. (A) comprises protein or mRNAs or their fragments. (M1) is
XX useful for: identifying markers of skin ageing and/or stress; determining
XX skin ageing and/or stress; and identifying or determining the effects of
XX pharmaceutical or cosmetic agents for control of skin ageing. The present
XX sequence is one of a group of human skin ageing/stress related expressed
XX sequence tags (ABQ86246-ABQ87680) of the invention

```
XX The invention relates to in vitro identification (M1) of genes expressed
CC in the skin of humans or animals by subjecting a mixture of genetically
CC encoded factors from skin, to serial analysis of gene expression (SAGE)
CC so as to identify skin-expressed genes and quantify their expression.
CC (M1) is useful for identifying genes involved in skin homeostasis; to
CC determine skin homeostasis and to test agent (A) that maintains or
CC promotes skin homeostasis or that can be used for treating skin
CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
CC rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
CC skin. The present sequence is that of a human expressed sequence tag

XX In vitro identification of skin-expressed genes, useful for determining
 PT homeostasis and identifying cosmetic or pharmaceutical agents against
 PT e.g. skin cancer.

XX PS Disclosure; Page 36; 1345pp; German.

XX The invention relates to in vitro identification (M1) of genes expressed
 CC in the skin of humans or animals by subjecting a mixture of genetically
 CC encoded factors from skin, to serial analysis of gene expression (SAGE)
 CC so as to identify skin-expressed genes and quantify their expression.
 CC (M1) is useful for identifying genes involved in skin homeostasis; to
 CC determine skin homeostasis and to test agent (A) that maintains or
 CC promotes skin homeostasis or that can be used for treating skin
 CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
 CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
 CC rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
 CC skin. The present sequence is that of a human expressed sequence tag

XX In vitro identification of skin-expressed genes, useful for determining
PT homeostasis and identifying cosmetic or pharmaceutical agents against
PT e.g. skin cancer.
XX
PS Claim 24; Page 305; 1345pp; German.
XX
CC The invention relates to in vitro identification (M1) of genes expressed
CC in the skin of humans or animals by subjecting a mixture of genetically
CC encoded factors from skin, to serial analysis of gene expression (SAGE)
CC so as to identify skin-expressed genes and quantify their expression.
CC (M1) is useful for identifying genes involved in skin homeostasis; to
CC determine skin homeostasis and to test agent (A) that maintains or
CC promotes skin homeostasis or that can be used for treating skin
CC disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
CC ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus;
CC rosacea; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the
CC skin. The present sequence is that of a human expressed sequence tag

XX
XX Decreasing transcriptional activity of genes for treating infections or
XX PT cancer, by administration of an agent that binds to two non-overlapping
XX PT regions of the gene.
XX
XX Example 13; SEQ ID NO 619; 98pp; English.
XX
XX The invention relates to a method of decreasing transcriptional activity
XX CC in a duplex deoxyribonucleic acid (DNA) template (T1) comprising
XX CC contacting (T1) with a binding agent comprising at least one small duplex
XX CC DNA-binding molecule (T2) coupled to at least one other small duplex-
XX CC binding molecule that binds to a non-overlapping region of target
XX CC sequence (TS). The method is useful for inhibiting transcription of a
XX CC range of disease-related genes for treating infections (by viruses,
XX CC including human immunodeficiency virus, bacteria, fungi, protozoa and
XX CC parasites), cancer, cardiovascular, respiratory, gastrointestinal,
XX CC endocrine/metabolic, rheumatic/immunological, haematological, musculo-
XX CC neurological, psychiatric, dermatological, ophthalmological,
XX CC skeletal, genetic or urogenital disorders. The method provides sequence-
XX CC specific inhibition of transcription of pathological genes without
XX CC affecting transcription of cellular genes regulated by the same
XX CC transcription factor, and can be applied to regulation of any gene.

XX Determining a human's capacity to metabolize a substrate of CYP2C19
XX PT

```

PT enzyme, useful for predicting a subject's likely response to drug or
 PT variations in drug response, comprises detecting polymorphisms within the
 PT region of the CYP2C19 gene.

XX Claim 2; Page 17; 35pp; English.

XX The invention relates to detection of certain polymorphisms in the 5'
 CC regulatory region of the gene encoding cytochrome P450 2C19 (CYP2C19)
 CC also known as S-mephenytoin-4'-hydroxylase. CYP2C19 enzymes are involved
 CC in the metabolism of many different xenobiotics. Human CYP2C19 gene is
 CC located on chromosome 10. The method is useful for predicting variations
 CC in an individual's ability to metabolise certain drugs. This is
 CC particularly useful for diagnosing or predicting an individual's likely
 CC response to drug, which is a CYP2C19 substrate, and in selecting subjects
 CC for clinical trials of such drugs. The present sequence is an antisense
 CC variant used for detecting human CYP2C19 gene 5' flanking region single
 CC nucleotide polymorphism (SNP)

Screening for sequence-directed DNA-binding molecules comprises adding a
test molecule to a test system composed of a DNA-binding protein and a
duplex DNA test oligonucleotide having adjacent screening and test
sequences.
XX PS
Disclosure; SEQ ID NO 619; 283pp; English.
XX CC
The invention describes a method for screening for molecules capable of
binding to a selected test sequence in a duplex DNA. The above method
comprises: constructing a duplex DNA test oligonucleotide having a
screening sequence adjacent to a selected test sequence, where a DNA-
binding protein is effective to bind to the screening sequence with a
binding affinity that is substantially independent of such test sequence,
but where DNA protein binding to the screening sequence is sensitive to
binding of test molecules to such test sequence; adding a test molecule
to be screened to a test system composed of the DNA-binding protein and
the duplex DNA test oligonucleotide having the screening and test
sequences adjacent one another; incubating the molecule in the test
system for a period sufficient to permit binding of the molecule being
tested to the test sequence in the duplex DNA; and comparing the amount
of binding protein bound to the duplex DNA before and after the adding.
The method is useful in screening libraries of synthetic or biological
compounds for their ability to bind DNA test sequences. The method may
also be used in characterizing the preferred binding sequences of any
selected DNA-binding molecule. This sequence represents a test sequence
corresponding to a promoter target of a human gene.

Sequencing an unknown DNA molecule for the polymerase chain reaction and
other primer processes comprises primer walking of octamer
oligonucleotides.
XX PS
Example 8; Col 209-210; 161pp; English.
XX CC
This invention describes a novel method for sequencing an unknown DNA
molecule which comprises selecting a library primer from an octamer
oligonucleotide library consisting of 48 8-bp sequences and corresponding
complementary sequences, where the library primer is complementary to a
known sequence adjacent to the unknown sequence or is complementary to a
sequence in a known extension product. The method is useful for DNA
nucleotide sequencing, in PCR, and in other processes which make use of
primers. The octamers are used to identify coding sequences. Primer
walking using the octamer libraries is advantageous over other sequencing
methods because it does not require multiple cloning steps nor subsequent
template preparations, and it is a directed and methodical approach.

XX PD Sequencing an unknown DNA molecule for the polymerase chain reaction and
XX PF other primer processes comprises primer walking of octamer
XX PR oligonucleotides.
XX PR Example 8; Col 81-82; 161pp; English.
XX  CC This invention describes a novel method for sequencing an unknown DNA
XX  CC molecule which comprises selecting a library primer from an octamer
XX  CC oligonucleotide library consisting of 48 8-bp sequences and corresponding
XX  CC complementary sequences, where the library primer is complementary to a
XX  CC known sequence adjacent to the unknown sequence or is complementary to a
XX  CC sequence in a known extension product. The method is useful for DNA
XX  CC nucleotide sequencing, in PCR, and in other processes which make use of
XX  CC primers. The octamers are used to identify coding sequences. Primer
XX  CC walking using the octamer libraries is advantageous over other sequencing
XX  CC methods because it does not require multiple cloning steps nor subsequent
XX  CC template preparations, and it is a directed and methodical approach.
XX  CC AAA80688-A81253 represent the octamer primers used in the primer walking
XX  CC method of the invention

XX PT Analyzing nucleic acids, used to analyze genomic variations and gene
XX PT expression levels, comprises mixing heat-denatured nucleic acid with a
XX PT labeled probe and a surface tethered capture probe.
XX PS Example 1; Page 42; 129pp; English.
XX CC Each of four possible cystic fibrosis (CF) mutations in a 138 bp target
XX CC (see AAB28762) amplified from exon 10 of the CFTR gene were represented
XX CC on a glass slide by a pair of probes, one complementary to the wild-type
XX CC allele and the other complementary to the mutant allele. Auxiliary
XX CC oligonucleotides were designed to produce a partially duplex structure
XX CC across the target fragment. The target molecules were hybridized to
XX CC oligonucleotide probe arrays tethered to the glass slides. The mutation
XX CC was detected using a novel method of nucleic acid analysis. The method
XX CC comprises mixing a heat-denatured nucleic acid sample with a molar excess
XX CC of at least one labeled oligonucleotide probe, hybridizing the mixture to
XX CC an array of oligonucleotide capture probes, surface-tethered to a solid
XX CC phase support, and analyzing the binding pattern on the support. The
XX CC length and sequence of the labeled probe is selected to anneal a unique
XX CC position in a target nucleic acid. The capture probes bind to the target
XX CC nucleic acid in tandem with the labeled probe. The hybridization
XX CC conditions are selected so that the capture probe can only bind to the
XX CC target strand when hybridized in tandem with the labeled probe, forming a
XX CC stable, contiguously stacked labeled probe/capture probe duplex structure
XX CC with no base mismatches, at, or near the junction of the two probes. The
XX CC method can be used for directly analyzing sequence variations between two
XX CC or more samples of genomic DNA by acquiring a quantitative hybridization
XX CC pattern for the DNA and comparing the patterns. The patterns can be used
XX CC to analyze gene expression at the transcription level in different
XX CC cellular samples

XX PT Screening, diagnosis or prognosis of breast cancer, by analyzing a sample
XX PT of serum or plasma by two dimensional electrophoresis to detect the
XX PT presence or level of a breast cancer-associated feature.
XX PS Claim 138; Page 41; 146pp; English.
XX CC The present invention describes a method for the screening, diagnosis or
XX CC prognosis of breast cancer (BC), determining the stage or severity of BC,
XX CC and monitoring the effect of therapy administered to a subject having BC,
XX CC comprising analysing a sample of body fluid by two dimensional
XX CC electrophoresis to generate a two-dimensional array of features,
XX CC comprising a chosen feature whose abundance correlates with BC or
XX CC predicts the onset or course of BC. The method (I) involves: (a)
XX CC analysing a sample of body fluid from the subject by two-dimensional
XX CC electrophoresis to generate a two-dimensional array of features,
XX CC comprising a chosen feature whose relative abundance correlates with BC
XX CC or predicts the onset of BC; and (b) comparing the abundance of each
XX CC chosen feature in the sample with the abundance of that chosen feature in
XX CC the body fluid from one or more persons free from BC, or with a
XX CC previously determined reference range for that feature in subjects free
XX CC from BC, or with the abundance of an expression reference feature (ERF)
XX CC in the test sample. The method is useful for screening, diagnosis or
XX CC prognosis of breast cancer, determining the stage or severity of BC,
XX CC monitoring the effect of therapy administered to a subject having BC, and
XX CC for identifying a subject at risk of developing BC. AAB87186 to AAB87340

XX
XX Analyzing nucleic acid samples of high genetic complexity, comprises
PT employing sequence-targeted tandem hybridization, in which
PT oligonucleotides are preannealed to target nucleic acid to form duplex
PT target molecule.
XX
XX Example 1; Col 21; 50pp; English.
PS
XX The invention relates to a method for analysing nucleic acids samples.
CC The method comprises employing a sequence-targeted tandem hybridisation,
CC where oligonucleotides that are preannealed to the single-stranded target
CC nucleic acid form a partially duplex target molecule. The methods are
CC useful for analysing nucleic acid samples of high genetic complexity, for
CC profiling gene expression using numerous oligonucleotide probes targetted
CC to mRNA species. The method provides an efficient identification of
CC species, strains and individuals using DNA probe arrays designed to
CC hybridise with numerous unique nucleotide sequences. The method directly
CC analyses nucleic acid samples without the use of additional steps of
CC target sequence amplification, single strand isolation and labelling. The
CC present sequence is a probe used for detecting mutation in human CFTR
CC gene exon 10 fragment used in the exemplification of the invention

XX
XX Isolated polynucleotides differentially expressed in antigen-presenting
XX PT cells, useful in gene vaccines against cancer.
XX
XX Claim 1; Page 67; 130pp; English.
XX
XX Sequences AAZ77573-279709 represent SAGE (serial analysis of gene
XX CC expression) tags used to identify mRNA transcripts encoding or
XX CC immunostimulatory cofactor proteins which are preferentially or
XX CC differentially expressed in monocyte-derived dendritic cells compared
XX CC with monocytes. Some of the transcripts correspond to known genes or ESTs
XX CC (expressed sequence tags) which were previously unknown to be
XX CC preferentially or differentially expressed in dendritic cells, while
XX CC other transcripts correspond to novel genes. Antigen-presenting cell
XX CC (APC)-associated costimulatory factors play an important role in the
XX CC activation of the cytotoxic immune response, particularly against tumour
XX CC cells. Tumour antigen presentation via the MHC (major histocompatibility
XX CC complex) and subsequent recognition by T-cell receptors is alone
XX CC insufficient to activate a robust cytotoxic immune response that can lyse
XX CC the tumour cells, immunostimulatory cofactors also being required for
XX CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
XX CC sequences identified using the SAGE tags have several potential uses.
XX CC They may be used in vaccines to induce an immune response, particularly
XX CC against a tumour antigen; to modulate the genotype of an APC; to screen
XX CC for agents that modulate expression of differentially expressed genes in
XX CC an APC; and as hybridisation probes/amplification primers for the
XX CC diagnosis, prognosis and monitoring of diseases related to abnormal
XX CC expression of these genes. Detection of the dendritic cell differentially
XX CC expressed genes, or of their encoded proteins, can be used to identify
XX CC cells as belonging to the monocyte lineage. Cells containing these genes
XX CC can be used in active immunotherapy (or to stimulate production of a
XX CC population of antigen-specific effector cells) and vectors containing
XX CC them are used in gene therapy. Co-administration of tumour antigens and
XX CC APC-associated costimulatory factors ensures adequate antigen
XX CC presentation to endogenous APCs and upregulates the APCs for the
XX CC presentation of co-stimulatory signals, migration to T cell-rich sites,
XX CC secretion of T cell growth factors and secretion of chemokines for
XX CC recruitment of immune effector cells

PT Isolated polynucleotides differentially expressed in antigen-presenting
 cells, useful in gene vaccines against cancer.

PS Claim 1; Page 104; 130pp; English.

XX Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene
 CC expression) tags used to identify mRNA transcripts encoding
 CC immunostimulatory cofactor proteins which are preferentially or
 CC differentially expressed in monocyte-derived dendritic cells compared
 CC with monocytes. Some of the transcripts correspond to known genes or ESTs
 CC (expressed sequence tags) which were previously unknown to be
 CC preferentially or differentially expressed in dendritic cells, while
 CC other transcripts correspond to novel genes. Antigen-presenting cell
 CC (APC)-associated costimulatory factors play an important role in the
 CC activation of the cytotoxic immune response, particularly against tumour
 CC cells. Tumour antigen presentation via the MHC (major histocompatibility
 CC complex) and subsequent recognition by T-cell receptors is alone
 CC insufficient to activate a robust cytotoxic immune response that can lyse
 CC the tumour cells, immunostimulatory cofactors also being required for
 CC efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid
 CC sequences identified using the SAGE tags have several potential uses.
 CC They may be used in vaccines to induce an immune response, particularly
 CC against a tumour antigen; to modulate the genotype of an APC; to screen
 CC for agents that modulate expression of differentially expressed genes in
 CC an APC; and as hybridisation probes/amplification primers for the
 CC diagnosis, prognosis and monitoring of diseases related to abnormal
 CC expression of these genes. Detection of the dendritic cell differentially
 CC expressed genes, or of their encoded proteins, can be used to identify
 CC cells as belonging to the monocyte lineage. Cells containing these genes
 CC can be used in active immunotherapy (or to stimulate production of a
 CC population of antigen-specific effector cells) and vectors containing
 CC them are used in gene therapy. Co-administration of tumour antigens and
 CC APC-associated costimulatory factors ensures adequate antigen
 CC presentation to endogenous APCs and upregulates the APCs for the
 CC presentation of co-stimulatory signals, migration to T cell-rich sites,
 CC secretion of T cell growth factors and secretion of chemokines for
 CC recruitment of immune effector cells

Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
XX
Claim 1; Page 174; 219pp; English.

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effector cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

XX treatment of cancer.

XX PS Claim 1; Page 143; 219pp; English.

XX CC AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
XX CC that are preferentially transcribed in the metastatic breast tumour
XX CC tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942
XX CC preferentially transcribed in the primary or non-metastatic breast tumour
XX CC tissue (i.e. are downregulated in metastatic breast tumour cells). These
XX CC transcripts can be used for diagnosis, prognosis, monitoring and
XX CC treatment of breast cancer, particularly where metastatic. Diagnosis is
XX CC by standard immunoassays or hybridisation/amplification reactions.
XX CC Compounds that modulate expression of the transcripts are potentially
XX CC useful for treatment of (metastatic) breast cancer, while promoters from

CC the transcripts are used to direct expression, in selected cell types, of
 CC e.g. therapeutic genes (also ribozymes or antisense sequences),
 CC particularly an antigen-encoding sequence for use in gene or cell-based
 CC vaccines. Polypeptides encoded by the transcripts are also useful in
 CC vaccines; for diagnosing breast cancer and for raising specific
 CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
 CC agents. Host cells that produce the polypeptides can be used to expand
 CC and isolate populations of educated, antigen-specific immune effector
 CC cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
 CC immunotherapy

PT Groups of genes expressed in human dendritic cells at a greater or lesser
 PT extent than in monocytes for investigation and diagnosis of autoimmune
 PT disease and tumors.

PS Claim 10; Page 13; 95pp; Japanese.

XX
 CC The present invention describes a group of genes consisting of 100 genes
 CC which are highly expressed in human dendritic cells; a group of genes
 CC which are expressed at a higher frequency in human dendritic cells than
 CC in human monocytes; and a group of genes which are expressed at lower
 CC frequency in human dendritic cells than in human monocytes. Each group of
 CC genes are characterized in that cDNAs of these genes respectively have
 CC the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID
 CC NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114
 CC to AAC74213), each is continuous with the base sequence 5'-CATG-3',
 CC located most closely to the poly-A region. The sequences can be used for
 CC the investigation of the role and mechanism of the involvement of
 CC dendritic cells in the immune system and for the study and diagnosis of
 CC diseases in which dendritic cells play a significant role, e.g. cancers
 CC and autoimmune diseases

XX Genes most frequently expressed in human monocytes and GM-macrophages and
 PT M-macrophages studied and with cDNAs characterized, for study of gene
 PT specificity, disease onset mechanism, drug development and diagnosis.

XX Claim 25; Page 109; 138pp; Japanese.

XX The present invention describes 100 human genes, which are expressed most
 CC frequently in human monocytes. The cDNA of each gene has a sequence fully
 CC defined in the specification, and lacking the CATG sequence located
 CC adjacent to polyA region. Also described are: (1) an antibody

CC specifically for the protein encoded by any of the genes; (2)
 CC oligonucleotides obtained from the cDNA sequences; (3) 380 human genes
 CC which are expressed most frequently in human macrophages, differentiated
 CC from human monocytes by granulocyte-macrophage colony-stimulating factor,
 CC the cDNA of each gene has a fully defined sequence, given in the
 CC specification, lacking the base sequence CATG located most closely to the
 CC poly A region; (4) an antibody specifically for the protein encoded by
 CC any of the genes of (3); and (5) oligonucleotides obtained from the cDNA
 CC sequences of (3). The genes and cDNAs, are used for the study of gene
 CC specificity and disease onset mechanism e.g. oncogenesis, genetic
 CC diseases, drug development and diagnosis. AAA56107 to AAA56586 represent
 CC specifically claimed oligonucleotide tag sequences for human genes
 CC expressed in monocytes and macrophages

XX Novel method of identifying target epitopes or antigens specific for
 PT human tumors, cancers and infected cells involving screening expression
 PT library products of a cell expressing the target epitope.

XX Disclosure; Page 68; 132pp; English.

XX AAA15239-50 represent arbitrary primers which are used for modified
 CC differential display of tumour antigens, in the method of the invention.
 CC The specification describes a method for identifying a target epitope.
 CC The method comprises screening the products of an expression library from
 CC a cell expressing the target epitope with cytotoxic T cells generated
 CC against the cell to identify DNA clones expressing the target epitope.
 CC The method may also comprise providing a cytotoxic T cell specific for a
 CC gene product differentially expressed by a cell and measuring the cross-
 CC reactivity of the cytotoxic T cell. The methods are useful for
 CC identifying tumour specific target epitopes and antigens which are useful
 CC in immunogenic compositions or vaccines to induce the regression of
 CC tumors, cancers or infections in mammals. The genes expressed in a panel
 CC of tumour cells that are derived from single immortalised, non-

CC tumourigenic cell line are used to generate HLA restricted cytotoxic T
 CC cells which are evaluated for activity against tumour cells. The method
 CC is useful to identify potential antigens expressed not only by the
 CC pathogen but also by the host cells whose gene expression is altered as a
 CC result of infection. The differential gene expression strategies can be
 CC applied to identify immunogenic molecules of cells infected with virus,
 CC fungus or mycobacterium

XX Genotyping cholinergic receptor, nicotinic, beta-polypeptide 2 gene of an
 PT individual involves determining for two copies of the gene, the identity
 PT of nucleotide pair at polymorphic sites selected from PSI-24.

XX Claim 17; Page 15; 82pp; English.

XX The invention relates to genotyping/haplotyping the cholinergic receptor,
 CC nicotinic, beta-polypeptide 2 (neuronal) (CHRN2) gene of an individual,
 CC comprising determining for the two copies of the CHRN2 gene present in
 CC the individual, the identity of the nucleotide pair at one or more
 CC polymorphic sites selected from PSI-24. Also include are oligonucleotides
 CC for performing the method and the nucleotide sequence of the polymorphic
 CC variants of CHRN2. The method is useful for detecting novel CHRN2
 CC polymorphisms and for determining if an individual has a haplotype or
 CC haplotype pairs defined in the specification and to validate CHRN2 as a
 CC candidate agent for treating a specific condition or disease predicted to
 CC be associated with CHRN2 activity (e.g. a memory disorder, Alzheimer's
 CC disease, epilepsy, a learning disorder, schizophrenia, attention
 CC deficit/hyperactivity disorder, (ADHD) and autosomal dominant nocturnal
 CC frontal lobe epilepsy (ADNFLE)), and in the design of clinical trials of
 CC candidate drugs for treating a specific condition or disease predicted to
 CC be associated with CHRN2 activity. The method is useful to screen for
 CC compounds targeting CHRN2 to treat a specific condition or disease
 CC associated with CHRN2 activity. The polymorphic nucleic acids are useful
 CC in studying the expression and function of CHRN2, and in expressing
 CC CHRN2 protein for use in screening for candidate drugs to treat diseases
 CC related to CHRN2 activity and are useful for therapeutic purposes. The
 CC CHRN2 gene is located on chromosome 1q21. The present sequence is an
 CC allele specific oligonucleotide (ASO) PCR primer (3' terminus) for
 CC performing the method of the invention

CC The present invention describes an isolated DNA molecule comprising a
 CC coding sequence of a yeast gene selected from a group of 745 NORF (not
 CC previously assigned open reading frame; or nonannotated ORF) genes
 CC comprising a SAGE (serial analysis of gene expression) tag. Also
 CC described are: (1) a method (M1) of using NORF genes to affect the cell
 CC cycle comprising administering a NORF gene whose expression varies by at
 CC least 10% between any two phases of the cell cycle selected from log
 CC antifungal drugs comprising: (a) contacting a test substance with a yeast
 CC cell; and (b) monitoring expression of a NORF gene whose expression
 CC varies as in M1, where a test substance which modifies the expression of
 CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
 CC identifying human genes which are involved in cell cycle progression
 CC comprising contacting human DNA with a probe which comprises at least 10
 CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
 CC and (4) a method (M4) for identifying a candidate drug as a member of a
 CC class of drugs having a characteristic effect on gene expression in a
 CC yeast cell comprising contacting a yeast cell with a candidate drug and
 CC monitoring expression in the yeast cell of at least 1 NORF gene whose
 CC expression is affected by the class of drugs. The NORF genes may be used
 CC to study, monitor and affect phases of the cell cycle, the differentially
 CC expressed genes may be used as markers of phases of the cell cycle. The
 CC methods may be used to identify candidate drugs which affect the cell
 CC cycle and for identification of antifungal drugs. AAF33268 to AAF4064
 CC represent SAGE tags used in the exemplification of the present invention.
 CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
 CC method, in the exemplification of the present invention

XX
XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.
XX
XX Example; Page 104; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF4064
CC represent SAGE tags used in the exemplification of the present invention.
CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC method, in the exemplification of the present invention

XX
XX  Yeast gene coding sequences comprising NORF genes with serial analysis of
PT  gene expression (SAGE) tags, useful for studying, monitoring and
PT  affecting phases of the cell cycle.
XX
XX  Example; Page 330; 419pp; English.
XX
XX  The present invention describes an isolated DNA molecule comprising a
CC  coding sequence of a yeast gene selected from a group of 745 NORF (not
CC  previously assigned open reading frame; or nonannotated ORF) genes
CC  comprising a SAGE (serial analysis of gene expression) tag. Also
CC  described are: (1) a method (M1) of using NORF genes to affect the cell
CC  cycle comprising administering a NORF gene whose expression varies by at
CC  least 10% between any two phases of the cell cycle selected from log
CC  phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC  antifungal drugs comprising: (a) contacting a test substance with a yeast
CC  cell; and (b) monitoring expression of a NORF gene whose expression
CC  varies as in M1, where a test substance which modifies the expression of
CC  the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC  identifying human genes which are involved in cell cycle progression
CC  comprising contacting human DNA with a probe which comprises at least 10
CC  contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC  and (4) a method (M4) for identifying a candidate drug as a member of a
CC  class of drugs having a characteristic effect on gene expression in a
CC  yeast cell comprising contacting a yeast cell with a candidate drug and
CC  monitoring expression in the yeast cell of at least 1 NORF gene whose
CC  expression is affected by the class of drugs. The NORF genes may be used
CC  to study, monitor and affect phases of the cell cycle, the differentially
CC  expressed genes may be used as markers of phases of the cell cycle. The
CC  methods may be used to identify candidate drugs which affect the cell
CC  cycle and for identification of antifungal drugs. AAF33268 to AAF44064
CC  represent SAGE tags used in the exemplification of the present invention.
CC  AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC  method, in the exemplification of the present invention

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
PT gene expression (SAGE) tags, useful for studying, monitoring and
PT affecting phases of the cell cycle.

XX Example; Page 229; 419pp; English.

XX The present invention describes an isolated DNA molecule comprising a
CC coding sequence of a yeast gene selected from a group of 745 NORF (not
CC previously assigned open reading frame; or nonannotated ORF) genes
CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log

CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064

XX Yeast gene coding sequences comprising NORF genes with serial analysis of
XX gene expression (SAGE) tags, useful for studying, monitoring and
XX affecting phases of the cell cycle.
XX
XX Example; Page 344; 419pp; English.
XX
XX The present invention describes an isolated DNA molecule comprising a
XX coding sequence of a yeast gene selected from a group of 745 NORF (not
XX previously assigned open reading frame; or nonannotated ORF) genes
XX comprising a SAGE (serial analysis of gene expression) tag. Also
XX described are: (1) a method (M1) of using NORF genes to affect the cell
XX cycle comprising administering a NORF gene whose expression varies by at
XX least 10% between any two phases of the cell cycle selected from log
XX phase, S phase and G2/M; (2) a method (M2) for screening candidate
XX antifungal drugs comprising: (a) contacting a test substance with a yeast
XX cell; and (b) monitoring expression of a NORF gene whose expression
XX varies as in M1, where a test substance which modifies the expression of
XX comprising contacting human DNA with a probe which comprises at least 10
XX contiguous nucleotides of a NORF gene whose expression varies as in M1;
XX and (4) a method (M4) for identifying a candidate drug as a member of a
XX class of drugs having a characteristic effect on gene expression in a
XX yeast cell comprising contacting a yeast cell with a candidate drug and
XX monitoring expression in the yeast cell of at least 1 NORF gene whose
XX expression is affected by the class of drugs. The NORF genes may be used
XX to study, monitor and affect phases of the cell cycle, the differentially
XX expressed genes may be used as markers of phases of the cell cycle. The
XX methods may be used to identify candidate drugs which affect the cell
XX cycle and for identification of antifungal drugs. AAF33268 to AAF44064
XX represent SAGE tags used in the exemplification of the present invention.
XX AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
XX method, in the exemplification of the present invention

CC comprising a SAGE (serial analysis of gene expression) tag. Also
CC described are: (1) a method (M1) of using NORF genes to affect the cell
CC cycle comprising administering a NORF gene whose expression varies by at
CC least 10% between any two phases of the cell cycle selected from log
CC phase, S phase and G2/M; (2) a method (M2) for screening candidate
CC antifungal drugs comprising: (a) contacting a test substance with a yeast
CC cell; and (b) monitoring expression of a NORF gene whose expression
CC varies as in M1, where a test substance which modifies the expression of
CC the yeast gene is a candidate antifungal drug; (3) a method (M3) for
CC identifying human genes which are involved in cell cycle progression
CC comprising contacting human DNA with a probe which comprises at least 10
CC contiguous nucleotides of a NORF gene whose expression varies as in M1;
CC and (4) a method (M4) for identifying a candidate drug as a member of a
CC class of drugs having a characteristic effect on gene expression in a
CC yeast cell comprising contacting a yeast cell with a candidate drug and
CC monitoring expression in the yeast cell of at least 1 NORF gene whose
CC expression is affected by the class of drugs. The NORF genes may be used
CC to study, monitor and affect phases of the cell cycle, the differentially
CC expressed genes may be used as markers of phases of the cell cycle. The
CC methods may be used to identify candidate drugs which affect the cell
CC cycle and for identification of antifungal drugs. AAF33268 to AAF44064
CC represent SAGE tags used in the exemplification of the present invention.
CC AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE
CC method, in the exemplification of the present invention

XX New human histamine H2 receptor (HRH2) isogene polymorphic variants,
PT useful in expressing HRH2 protein for use in screening for candidate
PT drugs to treat diseases related to HRH2 activity.
XX
XX Claim 17; Page 14; 62pp; English.

The invention relates to an isolated polynucleotide comprising a
polymorphic variant of a reference sequence for human Histamine H2
receptor (HRH2) gene, its fragment or complement, and the polymorphic
variant contains an HRH2 isogene defined by a haplotype listed in the
specification. Also disclosed are methods for haplotyping and genotyping
the HRH2 gene of an individual, a method for predicting a haplotype pair
for the HRH2 gene of an individual, identifying an association between a
trait and at least one haplotype or haplotype pair of HRH2 gene, allele
specific oligonucleotides (ASO) for performing the haplotyping/
genotyping, a recombinant nonhuman organisms transformed or transfected
with the polymorphic variant, the protein expressed by the polymorphic
variant, an antibody raised against the protein and screening for drugs
targeting the polypeptide by contacting HRH2 polymorphic variant with a
candidate agent and assaying for binding activity. The polymorphisms are
useful for studying the biological function of HRH2 gene, as well as in
identifying drugs targeting this protein for the treatment of disorder
related to its abnormal expression or function. The polymorphic variants
may be used in screening for compounds targeting CALM1 to treat a
specific condition or disease predicted to be associated with HRH2
activity, in studying the effect of the variation on the biological
activity of HRH2 as well as on the binding affinity of candidate drugs
targeting HRH2 for the treatment of acid-peptic disorders of the
gastrointestinal tract and also possibly human mammary cancer and gastric
carcinoma. The polymorphism and haplotype data can also be used for
validating whether HRH2 is a suitable drug target for drugs to treat acid
-peptic disorders of the gastrointestinal tract, screening of such drugs
and reducing bias in clinical trials of such drugs. The present sequence
is the 3' terminus of an ASO primer extension PCR primer used to detect
the polymorphisms of the invention

XX New isolated human oncostatin M polynucleotide, useful for therapeutic
PT purposes, for studying the expression and function of the polynucleotide
PT and for expressing oncostatin protein.
XX
XX Claim 18; Page 14; 71pp; English.

The invention relates to genetic variants of human oncostatin M (OSM)
gene. The invention also relates to compositions and methods for
haplotyping and/or genotyping OSM gene in an individual. Polynucleotides
of the invention are useful in studying the expression and function of
OSM, and in expressing OSM protein for use in screening candidate drugs
to treat diseases related to OSM activity. They are also useful for
therapeutic purposes. Methods of the invention are useful for determining
whether an individual has a haplotype or haplotype pairs. The method is
also useful for improving the efficacy and reliability of several steps
in the discovery and development of drugs for treating diseases
associated with OSM activity, e.g. cancer, diseases involving lung
inflammation and rheumatoid arthritis. The present sequence is a primer
used for detecting human OSM gene polymorphisms

PT  in screening for drugs to treat steroid biosynthesis disorders.
XX
PS  Claim 18; Page 15; 77pp; English.
XX
SQ  The invention relates to an isolated polynucleotide which is a
CC  polymorphic variant of human hydroxy-delta-5-steroid dehydrogenase, 3beta
CC  - and steroid delta-isomerase 1 (HSD3B1) gene. HSD3B1 polypeptide is
CC  useful for screening drugs which are used for treating diseases related
CC  to HSD3B1 activity. HSD3B1 DNA is used for treating disorders related to
CC  steroid biosynthesis such as congenital adrenal hyperplasia. A
CC  polymorphic variant of HSD3B1 is used for studying the effect of
CC  variation on the biological activity of HSD3B1, on the binding affinity
CC  of candidate drugs targeting HSD3B1 for the treatment of disorders
CC  related to steroid biosynthesis and in assays to measure the binding
CC  affinities of one or more candidate drugs targeting the HSD3B1 protein.
CC  A recombinant human transgenic animal is used for studying expression of
CC  HSD3B1 isogenes in vivo, for screening and testing for drugs against
CC  HSD3B1 protein and for testing the efficacy of therapeutic agents and
CC  compounds for disorders related to steroid biosynthesis in a biological
CC  system. HSD3B1 antibody is used for detecting HSD3B1 protein isoforms in
CC  biological samples, frozen tissue sections, cells which have been fixed
CC  or unfixed and prepared on slides, for use in immunohistochemical,
CC  immunocytochemical and immunofluorescence techniques. The present
CC  sequence is a primer used for detecting human HSD3B1 gene polymorphism

Novel polymorphic variants of aldo-keto reductase family 1, member b1
gene useful in studying expression and function of the protein, useful
for screening drugs to treat diseases e.g. diabetes.
Claim 18; Page 15; 103pp; English.
The present invention describes an isolated polynucleotide (I) comprising
a sequence which is a polymorphic variant (PV) of a reference sequence
for aldo-keto reductase family 1, member B1 (AKR1B1) gene or its
fragment, having the 22214 base pair sequence given in ABL01105. AKR1B1
has antidiabetic activity and can be used in gene therapy. AKR1B1 can be
used in the treatment of diabetes. The human AKR1B1 gene is located on
chromosome 7q35. ABL01107 to ABL01129 represent allele-specific
oligonucleotide (ASO) probes used in the detection of polymorphisms in
the human AKR1B1 gene; ABL01130 to ABL01175 represent ASO primers used in
the detection of polymorphisms in the human AKR1B1 gene; and ABL01176 to
ABL01221 represent preferred primers used in the detection of
polymorphisms in the human AKR1B1 gene

XX
CC The invention describes an isolated polynucleotide, which comprises genes and haplotypes of the small inducible cytokine subfamily A (Cys-Cys) member 20 (SCYA20) gene. The polynucleotide comprises polymorphic sites referred to as PSI-9 to designate the order in which they are located in the gene. The polymorphisms and haplotypes of SCYA20 gene are useful for validating whether SCYA20 is a suitable target for drugs to treat psoriasis and disorders associated with its abnormal expression or function, screening for such drugs and reducing bias in clinical trials of such drugs. Haplotype information would be useful in improving the efficiency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, early phase clinical trials. The methods are useful in screening for compounds targeting SCYA20 to treat a specific condition or disease predicted to be associated with SCYA20 activity, e.g. psoriasis. This sequence represents a primer extension oligonucleotide used to identify polymorphisms in the SCYA20 gene

 XX KW Genetically-modified non-human mammal where the genetic modification
 XX PT results in a disrupted RAMP1, RAMP2 or RAMP3 gene, such that agents can
 XX PT be identified which modulate the activity.
 XX PS Example 1; Fig 3; 29pp; English.
 XX CC The invention relates to a genetically-modified non-human mammal where
 XX CC the genetic modification results in a disrupted RAMP1 or RAMP3 (receptor-
 XX CC activity-modifying protein) gene. Also included are a genetically-
 XX CC modified non-human mammal where the mammal is heterozygous for a genetic
 XX CC modification which results in a disrupted RAMP2 gene and results in
 XX CC expression of an exogenous reporter gene under the control of regulatory
 XX CC sequences of the RAMP2 gene, a membrane preparation derived from the
 XX CC genetically-modified animal cell treating a disorder associated with
 XX CC liver function and/or muscle metabolism in a mammal where the method
 XX CC comprises administering an agent that modulates RAMP1 activity and
 XX CC identifying an agent that modulates RAMP1, RAMP2 or RAMP3 protein or gene
 XX CC activity. An agent which increases RAMP1 activity is used in the
 XX CC manufacture of a medicament for the treatment of a mammal with a disorder
 XX CC associated with liver function and/or a disorder associated with muscle
 XX CC metabolism. Disorders treated include heart failure, mitral stenosis,
 XX CC acute myocardial infarction, hypertension, chronic or acute hepatitis,
 XX CC hepatomegaly, hepatic steatosis, biliary atresia, gallstones, or
 XX CC chemical or drug-induced hepatotoxicity. The invention provides a means
 XX CC of understanding the complex role of RAMP in metabolism. The present
 XX CC sequence is the homology arm flanking a fragment of the RAMP2 gene used
 XX CC in an experiment to disrupt the RAMP 2 gene by homologous recombination

 XX The invention relates to SAGE (serial analysis of gene expression) tags
 CC representing groups of genes which are differentially expressed in human
 CC chronic hepatitis C (CH) liver tissue or hepatitis C-induced
 CC hepatocellular carcinoma (HCC) compared with normal human liver tissue.
 CC The SAGE tags of this invention consist of a sequence of 10 nucleotides
 CC located downstream of the 5'-CATG-3' sequence motif lying nearest to the
 CC polyA region of cDNAs derived from a variety of genes. These tags serve
 CC to uniquely identify each transcript and can thus be used to analyse the
 CC pattern of gene expression in particular cell types. The invention also
 CC relates to proteins encoded by the genes expressed in chronic hepatitis C
 CC liver tissue or HCC, antibodies against these proteins, and inhibitors of
 CC the expression of groups of genes that are overexpressed in chronic
 CC hepatitis C liver tissue or HCC. Groups of genes differentially expressed
 CC in chronic hepatitis C tissue or HCC may be used for the diagnosis and
 CC treatment of these diseases. Such genes, inhibitors of their expression
 CC or activity, and antibodies against the gene products may be used in the
 CC development of drugs to treat chronic hepatitis C and/or HCC. Sequences
 CC ABV84291-ABV84390 are SAGE tags representing the 100 least highly
 CC expressed genes out of those genes which are underexpressed in chronic
 CC hepatitis C liver tissue compared with normal liver tissue

 XX New haplotypes of human apolipoprotein C-IV gene, useful to diagnose and
 PT treat diseases associated with its activity such as hypertriglyceridemia.
 PF
 XX Claim 18; Page 14; 64pp; English.
 PS
 XX The invention relates to haplotyping the apolipoprotein C-IV (APOC4) gene
 CC of an individual, comprising determining if the individual has one of the
 CC APOC4 haplotypes or haplotype pairs fully defined in the specification.
 CC Haplotyping the APOC4 gene of an individual, comprises determining the
 CC identity of the nucleotide at two or more polymorphic sites in one copy
 CC of the gene. The method also comprises identifying an association between
 CC a trait and a haplotype or haplotype pair of the APOC4 gene, comprising
 CC comparing the frequency of the haplotype/pair in a population exhibiting
 CC the trait with that of a reference population. A higher frequency in the
 CC trait population indicates the trait is associated with the haplotype.
 CC The polymorphisms and screened compounds are useful for developing
 CC treatment for diseases associated with APOC4 activity such as
 CC hypertriglyceridaemia. AAS95580-AAS95634 represent human apolipoprotein C
 CC -IV allele-specific oligonucleotides of the invention

Representational Difference Analysis method for identification of
 antigens recognized by cytotoxic T cells and specific for human tumors,
 comprises improved selection of genes encoding target antigens.

Example 4; Page 19; 54pp; English.

The present invention relates to novel methods for the identification of
 antigens recognised by cytotoxic T cells (CTLs) and specific for human
 tumours, cancers and infected cells. The method involves screening the
 products of an expression library generated from DNA/RNA of a cell
 expressing a target epitope with cytotoxic T cells generated against the
 cell to identify DNA clones expressing target epitope or providing
 cytotoxic T cells specific for a gene product differentially expressed by
 a cell and measuring the cross-reactivity of the cytotoxic T cells for
 cells expressing a target epitope in which the target epitope is
 identified as a gene product inducing cytotoxic T cells. The method is
 useful for identifying a target epitope or antigen specific for a tumour
 cell. The target epitope is also useful for identifying target antigens
 in other target cells against which it is desirable to induce cell-

CC mediated immunity. The antigen identified by the method is useful in
 CC immunogenic compositions and vaccine preparations to induce the
 CC regression of tumours, cancers and infections in mammals. The invention
 CC also relates to vaccinia viral vectors which are useful for treating
 CC tumour-bearing mammals, including humans to generate immune response
 CC against the tumour cells. They are also useful for immunising or
 CC vaccinating tumour-free subjects to prevent tumour formation. The present
 CC DNA sequence is an arbitrary primer which is used for modified
 CC differential display of genes encoding potential tumour immunogens. This
 CC primer is used in the exemplification of the invention

Genetic variants of Plasminogen activator, Urokinase (PLAU) isogenes,
 useful for improving efficiency and reliability in drug development for
 treating thrombolytic disorders and cancer.

Claim 16; Page 14; 92pp; English.

The invention relates to a polynucleotide comprising a first nucleotide
 sequence (NSI) comprising a PLAU (plasminogen activator, urokinase, a
 serine protease) isogene selected from isogenes 1-9 and 11-20 given in
 the specification, where each isogene comprises the regions of the PLAU
 gene or cDNA and is further defined by the corresponding sequence of
 polymorphisms (defining single nucleotide polymorphisms, SNP). Also
 included are methods of haplotyping/genotyping (and predicting the
 haplotype/genotype of the PLAU gene of an individual, identifying an
 association between a trait and at least one haplotype or haplotype pair
 of the PLAU gene, an isolated oligonucleotide for detecting a
 polymorphism in the PLAU gene, a recombinant non-human organism
 transformed or transfected with the gene or cDNA, fragments of the
 polynucleotides of at least 10 base pairs encompassing a polymorphic

CC site, an isolated polymorphic variant PLAU protein or fragment, an
 CC isolated monoclonal antibody specific for PLAU, a computer system for
 CC storing and analysing polymorphism data for the PLAU gene and a genome
 CC anthology for the PLAU gene. PLAU is useful in screening for drugs
 CC targeting PLAU that are useful for treating thrombolytic disorders and
 CC cancers. The methods are useful for improving the efficiency and
 CC reliability of the discovery and development of drugs for treating
 CC diseases associated with PLAU activity, in validating PLAU as a drug
 CC target and in the design of clinical trials for treating a specific
 CC condition of disease associated with PLAU activity. The antibody is
 CC useful in diagnostic, prognostic and therapeutic methods. PLAU
 CC polynucleotides are useful in studying the expression and function of
 CC PLAU, and in expressing PLAU protein for use in screening for candidate
 CC drugs to treat diseases related to PLAU activity. The gene for PLAU is
 CC located on chromosome 10q24-qter. The present sequence is the 3' terminus
 CC of an allele specific primer used to amplify PLAU polynucleotides with a
 CC specific polymorphism using the technique of primer extension

 XX PT polymorphisms particularly single nucleotide polymorphisms in the
 XX PT optineurin promoter to diagnose, prognose and treat glaucoma and related
 XX PT disorders.
 XX PS Claim 11; SEQ ID NO 290; 159pp; English.

XX The invention relates to an isolated nucleic acid (N1) comprising at
 CC least 20 but not more than 1500 consecutive nucleotides of the optineurin
 CC promoter appearing as ADE13890. Also included are the optineurin promoter
 CC operably linked to a heterologous nucleic acid, a nucleic acid capable of
 CC detecting a single nucleotide polymorphism (SNP) in the optineurin
 CC promoter, a host cell comprising the promoter operably linked to a
 CC heterologous sequence, diagnosing or prognosing glaucoma in a sample
 CC obtained from a cell or bodily fluid (comprising detecting a polymorphism
 CC in a promoter region of the optineurin gene, associated with a glaucoma
 CC phenotype), detecting a SNP sequence variation in a sample containing
 CC DNA, detecting the presence of an optineurin promoter sequence variation
 CC in a sample containing DNA, determining the presence or increased
 CC susceptibility to glaucoma or to a progressive ocular hypertensive
 CC disorder resulting in loss of visual field in a patient (or the severity
 CC or progression of glaucoma in a patient, comprising providing
 CC amplification reaction primers that direct amplification of a selected
 CC nucleic acid region containing the variation within the optineurin
 CC promoter and amplifying the DNA) and detecting a polymorphism (comprising
 CC obtaining a sample containing human genomic DNA, providing a nucleic acid

CC capable of detecting a SNP located within an optineurin promoter, and
CC detecting the polymorphism). The invention is used to diagnose and
CC prognose glaucoma and also to treat glaucoma related disorders. The
CC present sequence is an optineurin promoter motif, repeat element or
CC putative regulatory region.

XX New nucleic acid sequences of the optineurin gene are useful to detect
XX polymorphisms particularly single nucleotide polymorphisms in the
XX optineurin promoter to diagnose, prognose and treat glaucoma and related
XX disorders.
XX
XX Claim 11; SEQ ID NO 289; 159pp; English.

CC The invention relates to an isolated nucleic acid (N1) comprising at
CC least 20 but not more than 1500 consecutive nucleotides of the optineurin
CC promoter appearing as ADE13890. Also included are the optineurin promoter
CC operably linked to a heterologous nucleic acid, a nucleic acid capable of
CC detecting a single nucleotide polymorphism (SNP) in the optineurin
CC promoter, a host cell comprising the promoter operably linked to a
CC heterologous sequence, diagnosing or prognosing glaucoma in a sample
CC obtained from a cell or bodily fluid (comprising detecting a polymorphism
CC in a promoter region of the optineurin gene, associated with a glaucoma
CC phenotype), detecting a SNP sequence variation in a sample containing
CC DNA, detecting the presence of an optineurin promoter sequence variation
CC in a sample containing DNA, determining the presence or increased
CC susceptibility to glaucoma or to a progressive ocular hypertensive
CC disorder resulting in loss of visual field in a patient (or the severity
CC or progression of glaucoma in a patient, comprising providing
CC amplification reaction primers that direct amplification of a selected
CC nucleic acid region containing the variation within the optineurin

CC promoter and amplifying the DNA) and detecting a polymorphism (comprising
CC obtaining a sample containing human genomic DNA, providing a nucleic acid
CC capable of detecting a SNP located within an optineurin promoter, and
CC detecting the polymorphism). The invention is used to diagnose and
CC prognose glaucoma and also to treat glaucoma related disorders. The
CC present sequence is an optineurin promoter motif, repeat element or
CC putative regulatory region.

XX New hairpin type polyamide used for treating cancer contains pyrrole and
XX imidazole units and alkylation site.
XX
XX Disclosure; SEQ ID NO 12; 46pp; Japanese.

CC The present invention relates to a new hairpin type polyamide that
CC contains N-methyl-pyrrole and N-methyl imidazole polyamide terminals and
CC an alkylation site linked through a vinyl linker. The method is used for
CC suppressing gene expression and treating cancer. The present sequence
CC represents a primer of the invention.
